

Inclusion of a prey model in forecasts of a specialised predator

A case study of the Iberian Lynx

Literature and Expert Knowledge

Demographic model

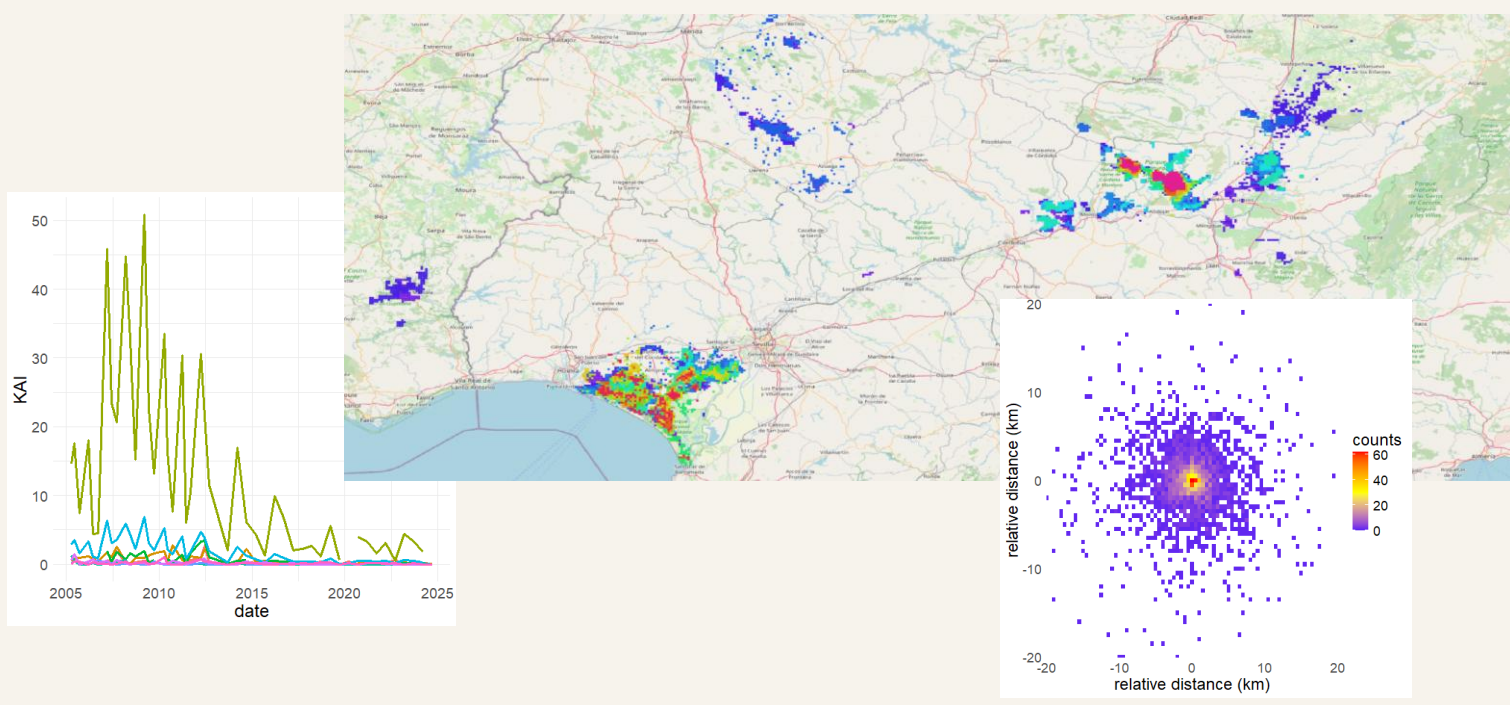

Aims

- PVA analysis for the Iberian Lynx
- Use IBMs to forecast complex systems
- Create useful and interpretable models for conservation agencies
- Quantify species interactions
- Identify data gaps
- Create models ready for integration for the Doñana Digital Twin

Model Calibration:

Estimate unknown model parameters using population information and spatial data

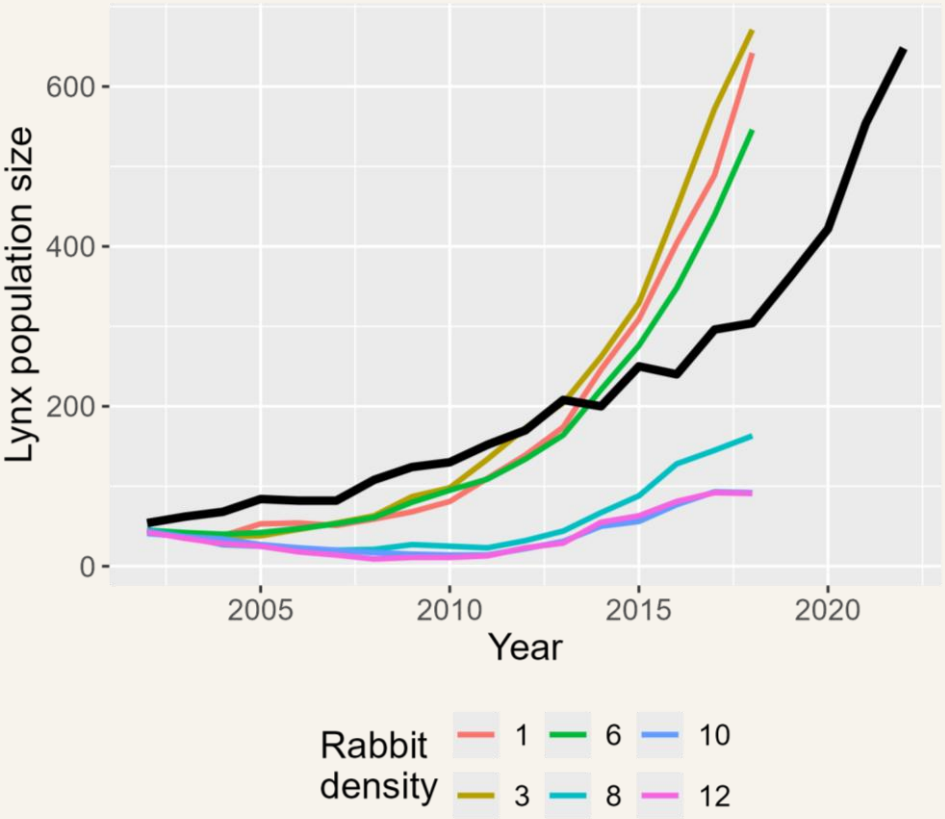

Final model:

- Use best estimates for parameters
- Understand uncertainty and forecasting time of model
